PROJECT ABSTRACT SUBMISSION

COURSE: PROJECT EVALUATION (24CS2235F) A.Y. 2026 - 2027

TITLE OF THE PROJECT	**Lexical Analyzer Tool**	
S. No.	**University ID**	**Name**
1	242030427	Y . Nimisha
2	242090498	K . Sanuhya
3	242030605	Y . Revanth
4	242030505	A . Nikitha
Name of the Guide		K S Niraja

Abstract

The Lexical Analyzer Tool is a compiler design project developed to demonstrate the first and one of the most important phases of the compilation process, known as lexical analysis. A lexical analyzer, also called a scanner, reads the source program character by character and converts the input into a sequence of meaningful tokens. These tokens include keywords, identifiers, operators, constants, literals, and special symbols.

The proposed tool analyzes the given source code, identifies different token categories, and displays them in an organized format. It also handles unnecessary white spaces, newline characters, and comments, which are generally ignored during the tokenization process. In addition, the tool helps identify invalid or unrecognized tokens and provides a better understanding of how source code is processed by a compiler.

The main objective of this project is to simplify the lexical analysis process and provide a practical understanding of token generation, pattern recognition, and symbol identification. It serves as an educational tool for students to explore the internal working of a compiler and understand how lexical analysis prepares the source code for the next phase, syntax analysis. Overall, this project demonstrates the fundamental concepts of compiler design through an interactive and systematic approach.
